The Value of Title Insurance

TOM HAYDEN, ESQ. AND JORDAN KELNER, ESQ.*©

*Proponents of new technologies take the position that the current title and escrow process is antiquated. Specifically, they assert that new technologies have the potential to make real estate transactions less complicated and more convenient, while still reducing risk and lowering costs. The question is whether any of these new technologies have the capacity to replace title insurance or eliminate its value. This paper argues that title insurance is a backstop for the shortfalls of the legal systems that govern real property, and that as such, title insurance will remain vital for the inevitable disconnect between new technologies and the laws that control their use. The title insurance industry has consistently proven technological change is simply an opportunity to give better value to its stakeholders. To the extent new technology has value, established title insurance companies are best positioned to integrate it to meet the changing needs of stakeholders.*¹

I. FUNDAMENTALS OF TITLE INSURANCE

Insurance products are about transferring the risk of loss from the insured to an insurance company.² In exchange for assuming this risk, the insurer receives payment, known as a premium.³ The insurance policy delineates the circumstances under which the insurer would be required to indemnify the insured by defining a universe of covered risks to create the insurance and setting forth various exceptions and exclusions to the covered risks.⁴ For example, an automobile

The Value of Title Insurance

insurance policy transfers the risk of damage to a vehicle from the vehicle's owner to the insurer.⁵ A covered risk under such a policy may include damage to the vehicle as a result of a collision and exclude against existing damage.⁶ As such, an insurance policy could be defined as a payment of a premium covering a specified policy period—in the case of an automobile insurance policy, a monthly payment of a premium covering damage occurring during that month.⁷

Most forms of insurance involve the payment of a recurring premium to obtain continuing coverage, but title insurance operates differently in that one premium is paid at the time of purchase or encumbrance.⁸ The reason for this difference is that the risk of loss transferred to the insurer involves existing legal rights rather than future physical damage or loss.⁹ In other words, the title insurance policy's universe of covered risks includes defects in title that exist as of the date of the policy that may divest the record owner of title or affect certain aspects of ownership, such as a right of access to the land or the marketability of the title.¹⁰ Likewise, the policy generally excludes defects that first arise after the date of the policy.¹¹ The retrospective nature of title insurance allows it to be purchased for a single policy premium and last as long as the insured retains their interest in the property.¹² As

(last visited Feb. 1, 2020); see also *Elysian Inv. Grp. v. Stewart Title Guar. Co.*, 105 Cal. App. 4th 315, 322 (Cal. Ct. App. 2002) ("Title insurance does not insure against future events.").

11. See *Loan Policy of Title Insurance*, AM. LAND TITLE ASS'N, <https://www.alta.org/policy-forms/> (last visited Feb. 1, 2020) (showing that certain covered risks are not subject to the exclusion for post-policy matters, but still follow the concept of insuring defects that existed at the time of the policy. For example, Covered Risk 11 of the 2006 ALTA Loan Policy includes coverage for mechanic's liens that have been recorded post-policy if the work began prior to the policy or was funded by the insured loan).

12. ALTA Homeowner's Policy (2013), *supra* note 9 ("This Policy insures You forever, even after You no longer have Your Title.").

discussed in detail throughout this paper, the underwriting process behind the creation of a title insurance policy builds the value of title insurance for both the individual transaction and the broader real property market.¹³

In addition to insuring against the existence of actual title defects, the title insurance policy obligates the insurer to defend any litigation in which a covered title defect is merely alleged.¹⁴ The insurer's duty to defend litigation has been described as "a valuable service paid for by the insured and one of the principal benefits of the liability insurance policy."¹⁵ Generally, the duty to defend extends to allegations in a complaint that have the potential to invoke the policy's insuring provisions, even if a title defect alleged in a complaint has not invoked a present obligation of indemnification under the policy.

II. TITLE INSURANCE VALUE – AN ECONOMIC VIEW

With the fundamentals of title insurance established, it is important to understand the connections between the stakeholders in real estate transactions, and how the operational efficiency of established title insurance companies affects their interests.

A. Investment in Real Estate

1. Individual Ownership

Historically, home ownership is financially beneficial for most families because it reduces housing costs and creates a managed system to build wealth in the home's equity.¹⁶ Additionally, as rising real estate prices increase the accumulated equity, the amount between what is owed on the liens against the property and the property's value increases.¹⁷ This promotes stability by creating a resource for

13. See generally Caroline Banton, *Underwriting*, INVESTOPEDIA, <https://www.investopedia.com/terms/u/underwriting.asp> (last updated May 13, 2019) (explaining that underwriting is the process by which the title insurance company researches documents that may affect the property's title and works with the parties to a transaction on eliminating identified exceptions).

14. See ALTA Loan Policy, *supra* note 11 ("[T]he Company ... shall provide for the defense of an Insured in litigation in which any third party asserts a claim covered by this policy adverse to the Insured."). See, e.g., *Buss v. Super. Ct. of L.A.*, 939 P.2d 766, 783–84 (Cal. 1997) (explaining that some states require the insurer defend against an entire lawsuit if a portion involves a covered matter); see, e.g., *GMAC Mortgage, LLC v. First American Title Insurance Co.*, 464 Mass. 733, 740–44 (Mass. 2013) (explaining that in many jurisdictions, the title insurer may also resolve its obligations to defend litigation pursuant to the other methods as described in the standard form policies).

The Value of Title Insurance

individuals if they ever experience financial hardship.¹⁸ Home equity is generally the largest component of an individual's net worth.¹⁹ In 2015, the home ownership rate in the United State stood at 63.7%.²⁰

Home ownership also has risks.²¹ When an individual buys real property without title insurance, the individual acquires the property without protection against liens, encumbrances, covenants, and other risks that bind a subsequent purchaser.²² Because real property carries tremendous value, these risks can lead to a significant decrease in the value of property.²³ Furthermore, challenging a title issue can be extremely expensive—sometimes topping hundreds of thousands of dollars in litigation fees.²⁴ For example, a lawsuit resulting from an adverse possession claim, even for an inch-wide strip of property, can require expensive discovery in the form of surveys, depositions, and expert witnesses.²⁵ A survey alone can cost over \$10,000.²⁶

Making the situation worse is the fact that property owners are not equipped to handle the cost of defending their title.²⁷ According to the Federal Reserve Board, 40% of Americans cannot cover a \$400 emergency expense, let alone resolve a title defect.²⁸ In the worst scenarios, expensive title litigation can drain resources, which could lead to default on their mortgage and the loss of the home.²⁹ Additionally,

29. See ALTA Loan Policy, *supra* note 11. In the event of default on a lender's encumbrance, the lender recovers what they can from the property through a foreclosure and eventual sale of the property to a third

the diligence, experience, and resources of title insurance underwriters continue to lower overall claims, thereby ensuring that individuals can buy property with less risk.³⁰

2. Banks

Lenders currently own \$9.1 trillion in mortgage-backed loans.³¹ The five biggest banks represent about \$1.47 trillion of these assets.³² Lenders face significant risk in a failing real estate market, as individuals are less likely to pay on loans that exceed the value of their homes.³³ Moreover, should the lenders' main recourse be the value of the properties their interests encumber, they could face significant losses in the event of a rise in foreclosures.³⁴ Therefore, institutional lenders have a significant incentive to encourage the continued stability of the real estate market.³⁵

3. Government-Sponsored Enterprises

The Federal Home Loan Mortgage Corporation ("Freddie Mac") and Federal National Mortgage Association ("Fannie Mae") are government-sponsored entities ("GSEs") created to expand the secondary market for mortgages.³⁶ The secondary mortgage market is where loans and servicing rights are sold from the originating lenders to investors.³⁷ Secondary mortgage lenders may keep the loans and service them, or package the loans into mortgage-backed securities to sell to investors such as pension funds, insurance companies, and hedge funds.³⁸

The Value of Title Insurance

The liquidity of that secondary market is dependent on the health of the real estate market.³⁹ If the real estate market fails, Freddie Mac and Fannie Mae are less likely to receive payment on the loans they buy, which reduces capital available to banks to make new loans.⁴⁰ If banks do not have the funds to make new loans, interest rates go up.⁴¹ When interest rates go up, fewer people want to buy homes, which depresses real estate prices.⁴² This vicious cycle is difficult to escape.⁴³ Freddie Mac and Fannie Mae understand this risk and place strict rules on the loans they are willing to buy, which includes a requirement that the loans are covered by a title insurance policy.⁴⁴

4. Government

The Federal Housing Administration (the “FHA”) is a self-funded United States government agency and the largest mortgage insurer in the world, with an active insurance portfolio of over \$1.3 trillion.⁴⁵ The FHA functions in the mortgage market as a specialized insurance company that guarantees the payment of mortgages made by private lenders.⁴⁶ As part of its role, the FHA sets standards for underwriting an FHA-backed loan.⁴⁷ The FHA’s investment mostly comes in the form of government-backed loans made through private lenders.⁴⁸ The FHA’s loan

programs provide support for buyers and homeowners who may be turned down for a traditional loan.⁴⁹ This means that there is little equity for the FHA to rely on in the event of a foreclosure.⁵⁰ If the FHA faced the burden of title risks on top of the lack of equity, the FHA's economics could fail.⁵¹ Thus, even though the FHA is self-funded, it is highly leveraged, and its stability depends on the stability and growth of the real estate market.⁵²

When the FHA runs out of money, it can only turn to a federal government bailout, which uses taxpayer dollars to save the agency from collapse.⁵³ The mechanics behind asking the government for money are challenging and the FHA has a strong interest in refraining from doing so.⁵⁴ The FHA requires title insurance for any FHA-backed loan to satisfy its desire to sustain its institutional longevity.⁵⁵

More generally, the government has an interest in economic stability and economic growth.⁵⁶ Real property has historically been one of the largest contributors to the nation's GDP.⁵⁷ Therefore, a strong housing market is an indication of a strong economy.⁵⁸ Title insurance plays a key role in supporting this critical market.⁵⁹

59. See generally *infra*, Section II, Part 2.

The Value of Title Insurance

B. Margins

The title insurance market exists to meet a demand for a low, fixed cost against potential title defects.⁶⁰ The one-time payment for a policy reduces the risk of incurring a loss that exceeds the value created from the land transaction.⁶¹ Additionally, the loan policy has value for the lender because it transfers the costs of handling title defects to an entity that specializes in title insurance.⁶² Over 90% of premiums paid to title insurance underwriters are spent on loss and expenses.⁶³ Losses are monies paid out under the policy as resolution of a title defect, such as an actual monetary loss paid directly to an insured, while expenses include attorneys' fees and costs and other overhead.⁶⁴

As explained in more detail below, laws affecting the transfer of real property differ between states and even between individual counties within a state.⁶⁵ The knowledge built internally and through established title insurance companies' network of agents represents billions of dollars in intrinsic value, which would cost individual lenders at least as much to duplicate.⁶⁶ This knowledge allows transactions to progress faster and more accurately, reducing delays and allowing lenders to cycle available capital faster, which generates millions, if not billions of dollars in time capital.⁶⁷

Given these margins, it makes sense that the government and GSEs would not want to consolidate the risk of operating a title insurance company with the risk of

67. See Olick, *supra* note 39.

loan repayment.⁶⁸ The government's choices greatly affect the private sector, as real property is mainly bought and sold using loans from banks that either use money from the federal government or are insured by the federal government.⁶⁹ Moreover, one reason title insurance is required is because it provides these entities protection that their investment was vetted and that the property is protected against unknown risk.⁷⁰ Thus, the requirement of title insurance from an established title insurance company provides ongoing confidence to the stakeholders in light of the uncertainties and risks involved in self-insurance and the likely increase in cost that would result.⁷¹

C. *Efficient Allocation of Expenses and Losses*

In most cases, the insurer has the option under the title insurance policy to pay the insured for their loss without taking remedial measures to fix the issue.⁷² However, because title insurance companies are businesses, they make the economic choice to incur expenses to cure a title issue rather than simply paying a loss. Without pursuing resolution in certain cases, losses would far exceed the expenses that would be spent under the policy. For example, if a prior lender claimed to have an outstanding balance of \$50,000 on their lien, and a title insurance company simply paid the balance, then the loss on the file would be \$50,000.⁷³ However, suppose the statute of limitations had run on that prior lien, rendering it invalid, and hiring an attorney to clear it would only cost \$5,000. In this scenario, the savings to the title insurance company would be \$45,000 (\$50,000-\$5,000).⁷⁴ The savings from this kind of cost-effective resolution by title companies is passed on to the stakeholders in the form of reasonable and stable premium amounts, which are of vital importance to those stakeholders.⁷⁵

III. CURATIVE FREE AND PURE RISK ASSUMPTION OFFERINGS

The stakeholders in real property transactions should be highly motivated to work with established title insurance companies because of the technologies deployed in

70. *Id.*

71. *Id.*

72. *ALTA Loan Policy*, ALTA, <https://www.alta.org/policy-forms/> (last visited Feb. 1, 2020) (“In case of a claim under this policy, the Company shall have the following additional options . . . [t]o pay or tender payment of the Amount of Insurance under this policy.” When the Company exercises that option, “all liability and obligations of the Company to the Insured under this policy . . . shall terminate including any liability or obligation to defend, prosecute, or continue any litigation.”).

73. This example, although simplistic, is illustrative of the type of decisions that claims attorneys regularly make about the path to resolution under the policy.

74. *Id.*

75. *See supra* Section II, Part 1.

The Value of Title Insurance

conjunction with their expertise.⁷⁶ However, some start-ups have begun offering discounted escrow services that are advertised as “curative-free” and relatively instantaneous.⁷⁷ These offerings advertise technology itself as a form of *deus ex machina*, whereby risk is reduced to a number and can simply be assumed without further effort.⁷⁸ This proposal is a risk assumption system of insurance which is relied on more heavily in other lines of insurance.⁷⁹ To support the contention that curative-free title insurance is a misnomer and that pure risk assumption is potentially catastrophic to the real estate economy and its stakeholders, this section first explains risk elimination, risk assumption, and the problems with an alleged curative-free or pure risk assumption model, and concludes by explaining the many barriers that these new entrants face to establish a successful title insurer.

A. Risk Elimination Versus Risk Assumption

1. Risk Assumption

The business model of insurance generally involves assuming and spreading risk among a pool of insureds.⁸⁰ State regulations require insurers to set aside a pool of funds, known as reserves, to ensure that the insurer is financially capable of paying claims, and some states even establish accounts funded by taxes on insurance premiums to guaranty payment of claims in the event of insolvency of an insurer.⁸¹ Loss for an individual is also mitigated by spreading the risk among many policyholders, setting premium amounts based on claim history and actuarial tables, and incentivizing risk-reducing behavior.⁸²

82. See Cyprian Ondieki Omari et al., *Modeling the Frequency and Severity of Auto Insurance Claims Using Statistical Distributions*, 8 J. OF MATHEMATICAL FIN. 137 (2018).

2. Risk Reduction and Risk Elimination

Courts distinguish between spreading assumed risk and risk reduction.⁸³ When an insurer takes action to reduce the likelihood of having to make a payment under a policy, it is known as risk reduction.⁸⁴ For example, an automobile insurance company may incentivize safer driving behavior by adjusting premiums based on the presence of safety features like airbags.⁸⁵ A health insurer may offer premium discounts for people who get blood tested during the policy period.⁸⁶ The goal for these insurers is to reduce the likelihood of an unknowable future event arising under those respective policies.⁸⁷

Title insurance is different from most other lines of insurance in that its core purpose has not been to insure against unknowable future occurrences, but rather knowable existing legal rights.⁸⁸ Because the title insurance policy insures the title to land, and defects in title exist in full or not at all, title insurers can eliminate a risk by identifying it and resolving it at closing.⁸⁹ This can be through agreements between the parties, obtaining additional assurances, or listing the risk as an exception.⁹⁰

As a result of their extensive knowledge of local land and title law, established title insurers know what they must do to eliminate risk.⁹¹ Resolution may range from paying taxes during a transaction to drafting an easement benefiting a property.⁹² The process of eliminating risks begins with the preliminary report and

92. See *infra* TABLE 1.

The Value of Title Insurance

may continue long after the transaction has closed.⁹³ For example, occasionally a property will be subject to a risk that an underwriter agrees to insure over with the understanding that the risk will be actively resolved after closing.⁹⁴ This allows the purchaser and lender to complete the transaction on time and under the intended loan terms, while also confirming that the known risk is eliminated for future transactions.⁹⁵

3. *Established Title Insurance Companies Still Assume Risk*

Established title insurance companies still assume risk because not all risks can be eliminated.⁹⁶ Risks that are assumed are typically the more serious and difficult title issues (such as fraud and property transferred by operation of law), but also included are those that cannot be eliminated without extraordinary effort and expense.⁹⁷ For example, it is prohibitively expensive to pull documents from every public office relating to a particular property, such as local public works and building departments that are not subject to the same recordkeeping requirements as the public records office.⁹⁸ Nonetheless, these documents may support a claim to title to the property even though they are not discoverable under state recordkeeping laws.⁹⁹

B. *Problems with a Curative-Free and Pure Risk Assumption Approach*

While a transaction may involve no curative work, it is highly unlikely the lack of curative work indicates a lack of defects.¹⁰⁰ For instance, it is common for properties to have covenants, conditions, and restrictions recorded against the property or a recorded easement for utility providers.¹⁰¹ Offerings that assert a

100. The form of the title insurance policy itself, by including standard exclusions and exceptions, presupposes the existence of such defects. See NIELSEN, *supra* note 8, § 11, 12 (discussing exclusions, which may involve matters that affect title but do not invoke insurance protection, and exceptions, which fall “within the scope of the covered risks but are removed from coverage.”).

101. In recognition of these risks, ALTA has promulgated endorsements that can be appended to the Policy to provide coverage for covenants, conditions, and restrictions. See, e.g., AM. LAND TITLE ASS'N, ENDORSEMENT 9.2-

quick and curative-free closing either senselessly take on the risk of these defects or improperly assume that buyers are willing to purchase, and lenders are willing to loan against, properties subject to serious defects.¹⁰² Thus, a curative-free approach as a business model for title insurance promotes short-term savings over long-term profitability.¹⁰³

Additionally, curative-free closings should greatly concern stakeholders to real property transactions.¹⁰⁴ Stakeholders want title insurance at a consistently low price and need properties to rely on as security.¹⁰⁵ By eliminating smaller risks, title insurers are able to focus considerable reserves on resolving more difficult issues.¹⁰⁶ A pure risk-assumption model fails to eliminate such risks, and would likely result in rapid increases in premiums year-over-year as titles become riskier to insure over time.¹⁰⁷ Additionally, the macroeconomic benefits that result from maintaining insurable titles and reducing risk for the stakeholders would be eliminated, including a rich secondary market for loans, low interest rates, and stakeholder confidence.¹⁰⁸ Failure to eliminate risk could be devastating to the long-term stability of a title insurance company and the entire real estate industry as a whole.

C. Barriers to Entry for New Title Insurers, Pure Risk Assumers

New entrants to the title and escrow market face an uphill climb to reach the value proposition achieved by established title insurance companies. These barriers to

108. See *supra* Section II, Part 2.

The Value of Title Insurance

entry include: (1) title plants;¹⁰⁹ (2) a strong knowledge of local laws;¹¹⁰ (3) a history of trusted service to stakeholders;¹¹¹ (4) challenging margins and high capital reserve requirements;¹¹² and (5) slow adoption rates of technology by the government.¹¹³

1. Title Plants

Generally, title plants duplicate public records for real property, adding information and additional cross-references that are not tracked by public record keepers.¹¹⁴ In many cases, title companies implement technology at the title plants to make searches of the title plant's records far more comprehensive.¹¹⁵ This makes title plants the primary source used by title insurance companies and their agents in the process of producing commitments.¹¹⁶ Creating and maintaining a title plant is a highly capital-intensive requirement.¹¹⁷ Ten states have statutory title plant requirements.¹¹⁸ Additionally, other states have marketable title statutes, which require a title company to review title knowledge going back a certain amount of years before producing a policy showing marketable title.¹¹⁹ For generations, established title insurance companies have been adding information to their title plants, organizing the legal documents in a manner optimized for searching, and identifying legal risks that would be impossible for new entrants to know and account for properly.¹²⁰

120. See Boyer & Nyce, *supra* note 109, at 287–88.

2. Expertise

What is even more capital-intensive than establishing a title plant, is the human capital required to run a title insurance company and resolve title insurance claims.¹²¹ Title insurance companies have a network of attorneys and title professionals that are experts in local title law.¹²² Between the major title insurance companies, there are over 50,000 trained title and escrow experts.¹²³ Major title insurance companies have in-house litigation departments that focus exclusively on litigating real property title issues, saving thousands in attorneys' fees.¹²⁴ Escrow professionals are trained to ensure that title defects are dealt with in accordance with the escrow instructions, while title experts are skilled at identifying knowable risks and providing guidance on how to cure them when found.¹²⁵ New entrants considering skipping this process place endless risk on the stakeholders.¹²⁶ Therefore, building and maintaining this base of human capital presents a significant roadblock for new entrants entering the market.¹²⁷

3. Historical Experience

Furthermore, a new entrant reliant on a computerized review of title records will take on risks that have already been identified by established title insurance companies or which would be flagged through established underwriting procedures.¹²⁸ For instance, if a fraudster had been recording forged encumbrances in Oklahoma, and the title insurance company had already paid prior claims and set procedures to identify those forged instruments in the underwriting process, risk of those claims would be mitigated by underwriting procedures.¹²⁹ Thus, after

128. See *infra* Section IV, Part 2.

129. See generally NIELSEN, *supra* note 8, § 9.1.

The Value of Title Insurance

hundreds of years of identifying issues and establishing ways to mitigate risk, established title insurance companies are working at a risk profile far below what any new entrant could match.¹³⁰ As internal computers are updated to reflect such risks, a title insurance commitment created by an established title insurance company becomes significantly more trustworthy than a new entrant's commitment.¹³¹ Thus, a new entrants into the market would face the risks posed by lack of experience, even if they possess the technology to review title records.¹³²

4. Finances

Title insurance is a capital-intensive business with statutory reserve requirements and variations in losses and expenses from year to year.¹³³ This is caused by changing real estate market patterns, added coverage for stakeholders, and other factors.¹³⁴ In order to capture business from the majority of stakeholders, new entrants into the market have to meet these requirements while simultaneously trying to build market share.¹³⁵ This is hard enough without also attempting to create a new business model for title insurance, such as the curative-free approach discussed above.¹³⁶ For example, certain companies use reinsurance as protection for their insureds in case their technology does not perform as expected.¹³⁷ However, even with reinsurance, a title insurance company that does not mitigate risk prior to insuring could face insolvency.¹³⁸ This is because reinsurance premiums could become too expensive after a high-loss year, and without the reinsurance, the business may no longer be able to operate.¹³⁹ Hence, reliance on reinsurance only works if risk mitigation is accurately implemented.¹⁴⁰ On the other hand, established title insurance companies can test new technologies to speed up the

title insurance process because their business model is not based on reinsurance.¹⁴¹ Less established companies betting their entire business model on untested technology do not have that luxury.¹⁴²

5. *Technology Adoption by Government*

If new entrants to the title insurance market are relying on technology adoption to change the fundamentals of their business, it is likely that they will be waiting a long time.¹⁴³ The nation's recording system is based on state law, but is implemented on a county-by-county basis.¹⁴⁴ Many if not most counties do not have the financial ability to improve their property records with technology.¹⁴⁵ This is illustrated by the multitude of jurisdictions without online property records or electronic recording.¹⁴⁶ Moreover, to the extent technology eliminates the need for government employees that currently manage the recorder's offices, local governments would be hard-pressed to resolve the displacement of those employees.¹⁴⁷

For example, in Hawaii a critical part of a 2018 court case involved whether the creation of a certificate number, without the issuance of a physical certificate, was sufficient under the Hawaiian Torrens system.¹⁴⁸ Due to Hawaii being four years behind on issuing certificates of title, the defendant owner asserted that a foreclosure could not be reflected on a certificate and a certificate number would need to suffice to promote the finality of foreclosures based on the reality of the state's massive backlog.¹⁴⁹ If Hawaii had the financial flexibility to implement a new

The Value of Title Insurance

system, it would probably have the financial flexibility to get through the backlog of certifications.¹⁵⁰ Thus, it does not seem likely that local governments have the ability or the desire to implement speculative technologies when they struggle to meet even their basic obligations as it stands today.¹⁵¹

IV. Future of Title Insurance

As detailed above, title insurance is strongly ingrained in the fabric of the real estate economy because the established title insurance system provides unmatched protection for stakeholders.¹⁵² As a result, stakeholders are confident in the validity of their transactions, and the real estate market benefits as a whole.¹⁵³ However, while established title insurance companies' procedures are the stakeholders' trusted method of protection, there is a question as to whether technology might impact what the stakeholders rely on going forward.¹⁵⁴ To match the time and experience involved in proper title insurance underwriting, new market entrants reliant on technology still face a tremendous cost to achieve the needed scale and may resort to shortcuts that do not benefit stakeholders in order to control costs.¹⁵⁵ Contrary to these entrants' marketing, established title insurance companies are best positioned to incorporate new technologies due to their extensive understanding of the law and the market.¹⁵⁶ A discussion of the frontier of technology and its promising applications in the real estate market continues below.

A. *New Technologies Changing Real Estate Transactions*

New technologies impacting real property transactions include fingerprinting, facial recognition, the cloud, and blockchain, all of which are discussed below in detail.

150. *Id.* at 384.

151. *Id.* at 378.

152. *See supra* Section II.

155. *See supra* Section III.

156. *See* Section III, Part 3.

1. *Fingerprinting and Facial Recognition*

Fingerprinting is the process of identifying a person by the impressions left from their fingers.¹⁵⁷ It has been used as a method of security for generations.¹⁵⁸ Fingerprinting has traditionally been done physically by taking an ink impression from a finger or object, and more recently through a computer or smartphone taking a digital impression of a user's finger.¹⁵⁹ In the real estate context, fingerprinting is incorporated into the notarization process.¹⁶⁰ As discussed in more detail below, the notarization process is more "security theater" than it is a device for stopping fraud.¹⁶¹

Facial recognition is the process of authenticating identity using a computer system that can match a face to previously authenticated pictures.¹⁶² Now, facial recognition technology common in new smartphones can verify the user by simply holding the camera up to the user's face.¹⁶³ The accuracy of facial recognition has developed to the point that it is trusted for everything from logging into mobile phones, accessing bank accounts, completing payments, and transferring funds.¹⁶⁴ Facial recognition has not been widely adopted in the real estate transaction context, but as explained below, it seems likely that facial recognition and electronic fingerprinting will be incorporated into the process.¹⁶⁵

Adoption of electronic fingerprinting and facial recognition will likely impact real property transactions because it is successfully being implemented by other

The Value of Title Insurance

businesses for their security and privacy needs.¹⁶⁶ For example, businesses are actively adopting fingerprint and facial recognition into their employee verification systems in addition to using passwords.¹⁶⁷ It is projected that widespread adoption of these technologies as a total replacement for usernames and passwords is imminent.¹⁶⁸ The main hurdle in implementing these two methods in real property transactions is that they are based on possessing previously verified sets of fingerprints or pictures.¹⁶⁹ Escrow and title insurance companies are working to leverage existing trusted fingerprint and facial recognition databases, or in the alternative, to use other verified information to confirm the identity of their customers.¹⁷⁰ We expect that title insurance companies will rapidly implement these technologies as soon as a trusted method of verification is developed.¹⁷¹

2. The Cloud

The cloud describes a network of servers acting as a single ecosystem.¹⁷² The cloud offers storage and computing services at a much lower cost than it would cost to build and maintain the necessary hardware and software internally.¹⁷³ Furthermore, major cloud providers also offer a full array of services, which include data analytics, developer tools, application monitoring, and other systems specially built for their customers' needs.¹⁷⁴

Whereas traditional software had to be accessed from the device where it was installed, the cloud can be accessed from any permissioned device.¹⁷⁵ Increasingly faster and more reliable internet access has contributed to the rise in popularity of

the cloud because it can now be accessed as seamlessly as local storage.¹⁷⁶ The trend now is for companies providing SaaS to have that technology stored, serviceable, and scalable on the cloud.¹⁷⁷ This is allowing companies that sell SaaS and those that use it for their business to grow faster than ever before.¹⁷⁸

3. Blockchain

Blockchain is a type of distributed ledger technology.¹⁷⁹ This means the subject data is distributed across a network of computers rather than being held at a single location.¹⁸⁰ Each place where the ledger is held is called a node.¹⁸¹ Blockchain technology uses cryptography (turning data into a format that can only be read by an authorized person) to secure each transaction.¹⁸² Each transaction generates a hash, which is a set of numbers and letters.¹⁸³ The hash depends not only on the current transaction, but also the previous hash.¹⁸⁴ Blockchain technology allows for transactions and data to be recorded, shared, and synchronized across all of the nodes, but only if a transaction is approved by the nodes.¹⁸⁵ Each participant on the blockchain receives a private password or key where ownership of a portion of the blockchain is recorded.¹⁸⁶ When a participant enters into a transaction, the nodes can confirm that the key is the correct key and finalize the transaction, creating the next block in the blockchain.¹⁸⁷

Blockchain has been one of the most sought after areas of investment for Fortune 500 companies since 2018.¹⁸⁸ Blockchain is being called Cloud 2.0, as it allows users to leverage the computing power and storage of computers all over

The Value of Title Insurance

the world.¹⁸⁹ Companies like Storj are building networks for decentralized cloud storage.¹⁹⁰ Storj operates by separating or “sharding” a stored file into smaller pieces on a blockchain, which can then be used to locate all of the shards of the original file.¹⁹¹ From the user’s perspective, the shards appear the same as they would on a centralized cloud.¹⁹² However, unlike a cloud, the shards are duplicated throughout the network to greatly reduce the chances of ever losing access to data as a result of an individual server going down.¹⁹³ Also, from a security standpoint, the only person that can access a user’s data in a decentralized cloud is the user, because the information is encrypted when it is added to the Storj blockchain, and the user is the sole owner of the encryption key.¹⁹⁴ Not even Storj can view a user’s information.¹⁹⁵

Storj is just one example of an active blockchain project. Even from this limited example, the benefits of privacy, security, and reliability are evident.¹⁹⁶ For these reasons, blockchain is also being considered for real property projects, such as land registries, insurance policy maintenance, and smart contracts in escrow applications.¹⁹⁷

a. Blockchain-Based Land Registries

A blockchain-based land registry requires all real estate transactions to be completed through recording on a blockchain.¹⁹⁸ In a video posted in September 2018, Chris Chrysostom, a senior software engineer at Overstock’s Medici Ventures, presented a discussion of the value of Overstock’s Medici Land Governance, a blockchain-based land registry system.¹⁹⁹ The system requires a map, a place to enter the property name or Assessor’s Parcel Number (“APN”), a place to enter the

property description, and evidence the owner has of their ownership.²⁰⁰ Chrysostom revealed that the goals of the blockchain-based land registry system are currently aimed toward digitizing unrecorded land rights or paper rights that are subject to manipulation.²⁰¹ Ultimately, the original value addition of a blockchain-based land registry appears to be electronic storage, the open-source nature of the rights, the alleged immutability of the record, and the confirmation of the transactions (which will be confirmed by an as-yet undefined type of voting system).²⁰²

For a more established public records system, like in the United States, blockchain registries could still have multiple benefits.²⁰³ For instance, a title report or preliminary report is produced using the latest title records available prior to the closing of the real estate transaction for both sales and refinances.²⁰⁴ This means that items recorded during the gap in time between when the title report is produced and the date of closing, which can be days or even weeks, become the risk of the title insurance company.²⁰⁵ With blockchain registries, title companies could become nodes with instantaneous access to fully up-to-date property records, reducing the gap period to minutes rather than days.²⁰⁶ Thus, a blockchain-based land registry could virtually eliminate the risk of gap recordings.²⁰⁷

b. Blockchain-Based Smart Contracts

In addition to blockchain-based land registries, blockchain has also been proposed as a solution for the challenges with smart contracts.²⁰⁸ Smart contracts are digital agreements that can be enforced automatically without the use of third parties or

The Value of Title Insurance

manual intervention.²⁰⁹ Blockchain-enabled smart contracts can help simplify complex transactions by limiting how many requirements are overseen by people.²¹⁰ Among these requirements are price negotiations, signature and identity verification, loan approvals, and remittance of funds, which can all be completed by the stakeholders, verified by nodes, and instantaneously updated on the blockchain.²¹¹ Smart contracts can involve as many stipulations as needed to satisfy the participants that the task will be completed satisfactorily.²¹² To establish the terms, blockchain platform participants must determine how transactions and their data are represented, agree on the rules that govern those transactions, explore all possible exceptions, and define a framework for resolving disputes.²¹³ It is usually an interactive process that involves both developers and business stakeholders.²¹⁴

An important question must be asked about this proposal: why does this have to be on a blockchain? The best answer is that blockchain provides an element of trust that is not otherwise available on a platform controlled by a third party.²¹⁵ The smart contract would be shared across all participants and would not be changeable by one participant without confirmation from the other participants.²¹⁶ Blockchain proponents argue that on the blockchain, there is no question about whether the terms originally agreed to are the same terms that are being performed later in the contract because the parties to the agreement are constantly getting updated ledgers.²¹⁷ However, it is unclear whether the stakeholders will feel safer given that the node agreement protocol (the computer code that controls how the transaction

operates) is like a foreign language to the participants.²¹⁸ If and how blockchain-based smart contracts in real estate transactions will be adopted is yet to be seen.²¹⁹

c. *Blockchain-Based Insurance Policy Storage*

Title companies are starting to explore the benefits of blockchain.²²⁰ Specifically, one proposal is to have a shared blockchain system to store and share the decisions made on prior title insurance policies.²²¹ This seems like a natural progression of the paper-based system used between title companies now.²²² The title companies working on this have shared little information about why blockchain technology is preferred for policy storage.²²³ However, interpreting the concepts that are discussed above, the benefits of a blockchain system provide a potentially trustworthy and nearly immutable ledger that could lead to greater transparency, efficiency, and accountability between title insurance underwriters.²²⁴ Additionally, if such a system can establish trust across multiple underwriters, more title companies will likely agree to participate.

B. *Legal Barriers to Technology*

The legal barriers to blockchain implementation stem from the foundations of property transfer laws in the United States.²²⁵ The legal barriers include the laws governing the recording systems, laws governing the validity of property transfers, state-specific regulatory schemes governing the unauthorized practice of law, the requirement that courts and governments have the ability to amend property records, and monoline insurance laws.

The Value of Title Insurance

1. The Recording Systems

There are two main types of recording systems: a race-notice system and a Torrens/Land Court system.²²⁶ The purpose of recording a document in a non-Torrens jurisdiction conflicts with the benefits promulgated by the proponents of a blockchain recording system.²²⁷ Specifically, blockchain proponents argue that, because the only person able to transfer or encumber the property is the owner of record, the title chain will become more accurate and accessible, which in turn will reduce fraud.²²⁸ However, imagine that an owner in a race-notice jurisdiction agreed in a signed writing to convey a portion of the property to Person A, and this agreement is known to Person B, but the document is not recorded. Later the owner records a second document conveying the property to Person B and this document is recorded. In the race-notice system, Person A would have the better claim to the property because Person B had knowledge of the earlier document. However, blockchain technology does not have the capacity to account for circumstances involving personal knowledge, as only Person B would have a recorded document, and only Person B would be able to convey the property again to fix the transaction.²²⁹

Additionally, states require most documents submitted for recording to be notarized.²³⁰ As a blockchain system does not provide for gatekeeping of documents in this way, the existing laws would need to change.²³¹ It is likely the laws will be updated whether or not blockchain is implemented.²³² Facial recognition, fingerprinting, and other identity verification procedures are simply better at preventing fraud than notarization.²³³

233. See generally Lauren Silverman, *Notaries Are Starting to Put Down the Stamp and Pick Up a Webcam*, NPR (June 12, 2017, 4:23 PM), <https://www.npr.org/2017/06/12/536888881/notaries-are-starting-to-put-down-the-stamp-and-pick-up-a-webcam>.

The other main type of recording system is a Torrens or Land Court system.²³⁴ Each time an owner transfers property, a master certificate maintained by a central office is updated to reflect new ownership information.²³⁵ Only information that is currently relevant to title is shown; these are called memorials or recitals on the certificate.²³⁶ Proponents of blockchain compare it to the Torrens and Land Court systems, in that the status of title on the blockchain is considered conclusive.²³⁷ However, blockchain would exhibit the same problems as the Torrens and Land Court systems when the record keeper fails to properly recognize documents on the certificate and stakeholders rely on the conclusive nature provided by the certificate.²³⁸ As illustrated by the example below, “conclusive” is not always conclusive.

One Hawaii claim involved spouses who owned property in a way that automatically transferred to the other upon death.²³⁹ The Hawaii Land Court, which is the record keeper under a Torrens-style recording system, recognized this ownership interest per the certificate as of 1999.²⁴⁰ In 2000, the husband was accused and convicted of murdering the wife.²⁴¹ The wife’s daughters from a previous marriage filed lawsuit against the husband to get back the property and recorded notice of the action against the property (“NOPA”). With the litigation pending, the husband got his conviction thrown out.²⁴² In 2005, the Land Court reissued the certificate without recognizing the NOPA.²⁴³ After taking out multiple loans, the Land Court later re-evaluated the NOPA and would not recognize the liens that were recorded post-NOPA.²⁴⁴ The Land Court decided that the first wife’s death had not been reflected on the certificate, and both the second marriage and the 2015 mortgage would not be recognized until the NOPA was removed.

244. *Id.*

The Value of Title Insurance

Thus, even a technological system aiming to achieve a high degree of definiteness will face challenges due to the multitude of laws that affect title to property.²⁴⁵ And, to restate the point illustrated by the example set above, the governing law for Torrens and Land Court jurisdictions would require a massive overhaul to allow for blockchain to be implemented either in concert with the existing system or a complete overhaul.²⁴⁶ In addition, from a public policy perspective, the lack of human oversight of a blockchain system is the opposite of the complete oversight exercised by Torrens record keepers and the Land Court.²⁴⁷ Thus, it does not seem likely that these jurisdictions would give up their decision-making role to a decentralized blockchain.

2. Legal Description

In the United States, the same property can be identified several different ways, including by legal description, assessor's designation, and government maps.²⁴⁸ All states have a codified "statute of frauds," which generally require that a transfer of property must provide a means to identify the property with reasonable certainty.²⁴⁹ However, "reasonable certainty" is a nebulous standard that can be established without a legal description at all, so long as a person can identify the land.²⁵⁰ As such, property descriptions can be vague and yet still provide constructive notice.²⁵¹ Surveyors have encountered legal descriptions with calls measured in "smokes."²⁵² "Smokes" obviously is not a legal term of art used by

experts, but instead a rough measurement system based on how many hand-rolled cigarettes can be smoked, possibly on horseback, while proceeding to the next call in the legal description.²⁵³ While the use of “smokes” as a measurement would be perplexing to any proponent of precision in legal descriptions, state law may consider it reasonably certain if a party could identify the land using the description.²⁵⁴

Blockchains are inherently “yes or no” answering systems, which makes confirming title to property with ambiguous legal descriptions impractical.²⁵⁵ Ambiguous legal descriptions are subject to drawn-out litigation, which would seem to undercut the idea of a sophisticated, peer-to-peer, real estate blockchain transferring system, since boundaries could not truly be certain.²⁵⁶ Thus, without the technological ability to allow the nodes to confirm the land described, the blockchain system of recording is nothing more than a convenient place to store records electronically.²⁵⁷

Moreover, given the “smokes” example mentioned above, it appears unlikely that some jurisdictions will ever be capable of transferring to a blockchain-based recording system.²⁵⁸ To update a modern recording system with blockchain, the land records need to be accurate, standardized, and digitized.²⁵⁹ Then, in order for blockchain to be useful, the land records and an indisputable mapping system would need to be reflected on the blockchain and universally used.²⁶⁰ In other words, precision and accuracy between legal descriptions and geographic information would be needed to make the goals of blockchain practical.²⁶¹ Based on the technological abilities we have today, the utility of transitioning to such a venture would likely do more harm than good in the form of a rapid rise of lawsuits claiming title to previously unknown descriptions.²⁶² As most Americans are not financially capable of defending lawsuits, this transition would be catastrophic to stakeholders.²⁶³

The Value of Title Insurance

3. *Unauthorized Practice of Law*

Roughly twenty percent of states require that an attorney be involved in a real estate closing, while some specifically require that the closing attorney perform nearly all aspects of the closing.²⁶⁴ For example, the Supreme Court of Georgia has said it is the unauthorized practice of law for someone other than a licensed Georgia attorney to close a real estate transaction or to prepare or facilitate the execution of deeds for the benefit of a seller, borrower, or lender.²⁶⁵ The State of Georgia understands this adds to the cost of the transaction, but stands by the importance of attorneys in real property transactions.²⁶⁶

For blockchain to be used in real estate closings, the nodes would need to review elements of the transaction (i.e. the parties, the property, and potentially even a full commitment) and then approve the transaction.²⁶⁷ However, approving elements of real estate transactions requires a licensed attorney in attorney-agent states.²⁶⁸ Thus, the parties hosting the nodes may be considered to be unlawfully practicing law.²⁶⁹ Further, anyone using the blockchain platform, including the creators of the platform, could be considered to be assisting with the unauthorized practice of law.²⁷⁰ Thus, either the nodes need to have a more limited function (which would limit the utility of a blockchain platform) or the legal framework would need to be changed prior to implementing blockchain.²⁷¹

4. *Courts, Registries, and Government Oversight*

The idea of enhanced technologies making property more accessible and transferable has its limitations.²⁷² Both the courts and the registrar need the ability to adjust the blockchain ledger to resolve disputes.²⁷³ For instance, if bad data was

entered and discovered, someone would need the ability to change it.²⁷⁴ Legal actions are often asserted against people who are either unavailable or unwilling to engage in transacting property.²⁷⁵ The courts need the ability to adjust the blockchain to reflect the status of title through the power of a court order.²⁷⁶ In addition, the government has eminent domain power and can transfer property from a private individual to itself.²⁷⁷ Presently, a blockchain transaction requires each party to a transaction to approve it through the application of their private key.²⁷⁸ In other words, a court could not unilaterally alter an existing blockchain transaction.²⁷⁹ A procedure for government entities to create and update the blockchain would have to be in place before a blockchain-based system could govern titled property.²⁸⁰

5. Other Legal Considerations

As title insurance policies inevitably change moving forward, title insurance companies maintain the core focus of their policies on title-related defects.²⁸¹ Laws placing consumer protections on monoline insurance limit the places available to buy title insurance to companies that specialize in title insurance.²⁸² This has been considered necessary because of the risk that financial instability has had on multiline insurance companies and the importance of the stability of title insurance companies.²⁸³ If searching the title were to require less specialization, it could give multiline carriers an opportunity to convince regulators that the monoline

The Value of Title Insurance

restrictions are no longer necessary to ensure consumer protection.²⁸⁴ Should monoline restrictions fail and the competitive landscape change, title insurance could become a race to the bottom and put stakeholders at risk.²⁸⁵

C. Blockchain Versus Cloud-based Software Solutions

Even if blockchain can overcome all the challenges imposed by the legal landscape, whether it will be implemented in the title and escrow context depends on whether it is better than a traditional cloud-based solution at making the process faster, cheaper, safer, and more convenient.²⁸⁶ Before technology is implemented, the technology providers must show that the technology will resolve a problem or provide efficiency unavailable through other means.²⁸⁷ Blockchain companies have not demonstrated how their technology improves the title process or why it is better than the cloud.²⁸⁸ Currently, different jurisdictions in the United States have digitized and non-digitized registries.²⁸⁹ In jurisdictions with only paper records, title plants have made a good portion of those areas technologically capable.²⁹⁰ For currently digitized title records, title companies already have the technology to create nearly instantaneous commitments.²⁹¹ There does not appear to be any current proposal that explains why a non-blockchain software system is less effective at creating commitments.²⁹²

At the escrow level, the same question exists as to whether blockchain makes the system faster, cheaper, or more convenient.²⁹³ The best argument for blockchain is that all stakeholders will be able to automatically contribute their part of the transaction simultaneously to the other parties, thereby reducing delay from a person collecting documents, reviewing the information, and communicating it to the parties.²⁹⁴ However, these potential benefits are not unique to blockchain and can be attained using cloud-based software.²⁹⁵ The reason fully automated transactions are not more widely used is because of the inconsistency in software among stakeholders and the inability to form a consensus.²⁹⁶ Blockchain projects

focusing on smart contracts are built within a particular proprietary blockchain environment.²⁹⁷ More precisely, these blockchain smart contract systems are still software-based solutions, and software varies between providers.²⁹⁸ Thus, it does not appear that blockchain resolves the agreement issue at this time.²⁹⁹

Safety and security may be the strongest case for the adoption of blockchain.³⁰⁰ Blockchain ledgers are stored at multiple locations, which significantly reduces the risk that the ledger can be fraudulently changed.³⁰¹ In the recording context, unlike a traditional recording system where anything can be recorded and identity verification is dependent on the honesty of a notary, blockchain's consensus requirement could lead to a stricter evaluation of what can be added to the blockchain, compared to the traditional recording process and software-based solutions.³⁰² Similarly, with blockchain policy storage, the safety of policies is better

The Value of Title Insurance

kept on multiple nodes, as prior policies are often lost when title companies cease to operate or suffer technological failures.³⁰³

D. Effect of Technology Adoption on Title Insurance

In a world where money is not a factor and the legal system could instantaneously adapt to get the most out of improved technology, the technologies discussed herein could lower the possibility of claims and reduce transaction costs.³⁰⁴ However, viewing these technologies practically, it is not likely that they will impact the value of title insurance any differently than previous technological improvements. As this paper has reiterated, the value of title insurance is that it allows for the continued free flow of real estate by giving buyers and lenders the information to understand the title risks of their investment and protection against the unknown risks.³⁰⁵ Unknown risks come in the form of discoverable risks, undiscoverable risks, and related risks like access and encroachments.³⁰⁶ The technologies discussed herein aim to create easier ways to obtain information regarding the status of title, connect property stakeholders in a way that reduces the likelihood of unknown risks, create commitments faster, and expedite the escrow process.³⁰⁷ In this Section, Subsection 1 reviews why blind faith in technology is not a good business practice for a title insurance company, Subsection 2 reiterates why the value of title insurance will remain strong, even with technological development, and Subsection 3 articulates the improved value that title insurance will have as new technology is implemented.

1. Risk Assumption and Technology

As discussed above, risk-assumption-model startups suggest that technology will impact title-related information to such an extent that an accurate title report could be created by anyone at the press of a button, making a title insurance policy less valuable.³⁰⁸ However, the creation of the title commitment has always been based on information freely available to the public, and the limiting factor of time and expense has been steadily decreasing.³⁰⁹ Therefore, the focus should not be on the

potential cost reduction of retrieving the title information, but the impact of title insurance after the creation of the commitment.³¹⁰

2. *Technology Will Not Eliminate the Value of Title Insurance*

The title insurance policy protects against risks not listed in the commitment (unidentified risks and unknowable risks), which will be true regardless of whether people or machines create the commitment.³¹¹ Specifically, as shown in TABLE 1, only 25% of claims result from an error searching the title records.³¹² This means that even if title records were 100% accurate and instantaneous commitments were available with perfect prevision, 75% of claims would still exist.³¹³

Risks not identified in the search escape detection because documents may contain errors and be mis-indexed or misinterpreted.³¹⁴ For example, some deeds contain automatic reversion interests that are triggered by the occurrence of an action by the new owner, like selling alcohol on the premises.³¹⁵ The legal system has a shortfall in that the automatic legal rights vest regardless of the chain of title.³¹⁶ Similarly, joint tenancy (whereby one owner takes title automatically upon the death of the other joint tenant) operates the same way.³¹⁷ Thus, ownership by grantor-grantee transfer in the record chain of title does not take into account how these properties are owned and how they can be transferred outside the record chain of title.³¹⁸

TABLE 1³¹⁹

Other risks are not knowable because they arise from information that is not publicly available; however, modern policies still cover those risks.³²⁰ For example, state statutes allow for mechanic's liens to be recorded up to a certain amount of time after construction work has been completed on a property.³²¹ Work is often finished shortly before closing, but the mechanic's lien is not recorded until weeks later.³²² Due to this shortfall of the legal system, title insurance has stepped in to

mitigate this risk for stakeholders and protect what would be considered a *bona fide* purchaser under any other circumstance.³²³

Furthermore, there is the ever-present risk of fraud and manipulation, and fraudsters will likely invent new ways to facilitate fraud despite additional technological improvements.³²⁴ Fraud often occurs when a notary is complicit in falsifying a document.³²⁵ For example, an owner of a property financed his purchase by receiving a loan from his father, secured by a mortgage in favor of the father.³²⁶ The son found himself with deep financial issues and forged his father's signature on a document purporting to release the mortgage as fully satisfied.³²⁷ He then brought the forged document to a friend who had recently received a notary license.³²⁸ The son convinced his friend to notarize the release, and the friend agreed.³²⁹

Blockchain would not directly resolve fraud problems like this.³³⁰ Existing legal structures would still govern how new transactions would be entered into the blockchain, including notary, acknowledgement, and deed requirements.³³¹ If a document has all of the elements to create the next block in the blockchain, it will still be recorded in the blockchain.³³² This is because the blockchain solely memorializes the fact that the transaction has occurred, but does not verify the

332. See Natarajan, *supra* note 179, at 6 (discussing the consensus mechanism for blockchain).

The Value of Title Insurance

validity of the transaction.³³³ Therefore, fraud, forgery, and incompetence are not necessarily resolved by the blockchain process.³³⁴

Even if new requirements were set up to resolve potential fraud on the blockchain, it is likely that people will come up with new ways to perpetuate fraud and abuse the system.³³⁵ For example, fraudsters may discover ways to deceive the identity verification procedures that are put in place to allow for fully automated and online transactions.³³⁶ For instance, imagine that a party was operating under a fraudulently created power of attorney. The verification process would verify the holder of the power of attorney, but not that the power of attorney document itself was sufficient. In such a case, the current policy would still provide coverage for the unenforceability of the lender's loan.³³⁷ Thus, the title insurance policy retains its value in protecting against fraud.³³⁸

3. Technology Will Improve Title Insurance Value

Furthermore, title insurance is a regulated industry, so margin expansion as the result of technological improvement is more likely to result in lower costs or more value for customers.³³⁹ Title insurers have done this throughout their history.³⁴⁰

Major changes include the proliferation of endorsements for the Loan Policy, which provide additional insurance at little to no cost for lenders.³⁴¹ Additionally, most title insurers offer an entirely new policy to protect homeowners, called the Homeowner's Policy of Title Insurance, which provides increased protections, such as coverage for forced removal as the result of permit failures and encroachments, despite these issues not being available in the public records.³⁴²

ALTA is already considering proposals that include changes in preparation for additional technological improvements in title and escrow, such as coverage for attacks on title based on the invalidity of electronic signatures under applicable statutes.³⁴³ Thus, there is no indication that the value of title insurance will ever be eliminated as most claims are not resolved by the technologies discussed herein.³⁴⁴

CONCLUSION

Most of the technologies proposed herein are in their infancy, especially blockchain.³⁴⁵ The companies that are supposedly revolutionizing the title insurance industry are not proposing solutions that will add value to the modern automated title search that currently exists today.³⁴⁶ Until a company can demonstrate that it is financially and practically feasible to use blockchain, the status quo will continue to dominate.

Additionally, to the extent these technologies advance in a way that make them financially and practically feasible, it is possible that title insurance companies will need to adapt to maintain market share.³⁴⁷ However, as the theme throughout this

341. See *Everything You Need to Know About Title Endorsement – And Whether You Need It*, QUICKENLOANS (Jul. 8, 2019), <https://www.quickenloans.com/learn/title-endorsement> (reasoning that although such endorsements may not cost a lot, owners need to inquire into the potential benefits).

344. See Kammerdeiner & Sadler, *supra* note 272 ("Blockchain technology holds infinite possibilities that could help make current processes in our industry and society more efficient; however, it will never be able to do what title insurance professionals do each day: provide peace of mind and protect property rights. Homeowners and lenders have relied on our services for generations. Emerging technologies will not replace the assurances that title insurance provides.").

345. See Bernard Marr, *A Very Brief History of Blockchain Technology Everyone Should Read*, FORBES (Feb. 16, 2018, 12:28 AM), <https://www.forbes.com/sites/bernardmarr/2018/02/16/a-very-brief-history-of-blockchain-technology-everyone-should-read/> (discussing how Bitcoin debuted blockchain technology in 2008, but exploration of other uses for blockchain did not take off until 2014).

346. See *supra* notes 198–202.

347. See *Title Insurance Companies Focusing on Tech like Their Lives Depend on It*, PROPMODO (Mar. 8, 2018), <https://www.propmodo.com/title-insurance-companies-focusing-tech-like-lives-depend/>. Established title insurance companies have increased the value of title insurance for stakeholders over time. *Title Insurance*:

The Value of Title Insurance

paper suggests, because established title insurance companies are practically and economically positioned to protect the interests of real property stakeholders, they will continue to be uniquely prepared to negotiate the challenges of incorporating technology into the existing business and legal structure.³⁴⁸
